

Installation Instructions

P/N HTK-02 Swing Panel Kit

The HTK-02 Swing Panel Kit is designed to support the installation of subpanels and dead-fronts that require the ability to open, or swing.

Using this system, you can install swing panels that open left, right, up, or down within the PolyGuard Series enclosure base. The system is simple and robust, and requires no holes in the base of the enclosure.

The kit includes one spring-loaded hinge assembly and one static hinge assembly, as well as four rivets for attachment to your panel.

Note that each hinge assembly includes a tab for a grounding lug.

For installation, the BPA-004 kit is required.

To install, attach the hinge pins to the subpanel. Then, just snap the assembly into the BPA-004 Mounting Pads as shown. Close the panel using any #10-32 screw.

Please call us with any questions or comments.
